It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      All repeats were identified using RepeatMasker:
Smit, A.F.A. & Green, P. (1996-1997)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

consistency that the states to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular consistency and also specifically, it refers to candidate agents that considers. Specifically, it refers to candidate agents that considers apable of modularing the activity of target proteins having motor of phosphate. Furthermore, this activity can be determined using or phosphate. Furthermore, this activity can be determined using considerate that identifies modulators of the target protein, which is a method that identifies modulators of the target protein, which is a considerate, can be used for the transmined cancer, hyperplasias, the statistic hypertrophy, incompassible that inflammatories. Accordingly, through gene therapy, they can be used for the transmined cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation. This colymucleotide sequence is human KID DNA (SeqID 5) encoding a full length can be used for the transmined sorders and inflammation. This can be also seen that the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1041 BP; 228 A; 295 C; 302 G; 216 T; 0 U; 0 Other;

This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding the human kinesin-like DNA binding protein (KID) (SeqID 7)

proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, modulators of the target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders and as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and angioplasty. This sequence represents DNA encoding a human microtubule motor protein of the invention.

```
fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplasias, tastenosis, cardiach hypertrophy, immune disorders and inflammation. This polynucleotide sequence is human KID DNA (SeqID 7) encoding a full length KID enzyme of the invention.
                                                                                                                                                                                                                                                                                                  120

                                                                                                       The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated Arpase activity, a method of testing for Arpase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or biological activity of a target protein, modulators of the target protein, and methods of treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with Kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for

This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of cellular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using fluorescence or absorbance readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (known as KID) as cytostatic, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /product= "KID protein"

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening cardial encoding them. The invention also relates to a method of screening for Appase activity of microtubule stimulated Arpase activity, a method of testing for Appase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a macdilator of the binding characteristics or protein, and methods of treating cellular proliferation disorders such a protein, and methods of treating cellular proliferation disorders such a cancer, hyperplasias, restences; cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor proteins useful for treating cellular proliferation disorders such as cancer, hyperplasias, restences; cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating autoimmune colliseasing induced after medical procedures including surgery and proliferation induced after medical procedures including surgery and angioplasty. This sequence represents DNA encoding a human microtubule concordes the protein featured as SEQ ID NO:2, but this does not appear to be the case.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to a novel method for high throughput screening systems used to identify compounds for the treatment of callular proliferation disorders. Specifically, it refers to candidate agents that are capable of modulating the activity of target proteins having motor domains, such that the target protein directly or indirectly produces ADP or phosphate. Furthermore, this activity can be determined using or phosphate. Furthermore readouts. The present invention describes a method that identifies modulators of the target protein, which is a kinesin-like DNA binding protein (Known as KID) as cyrostaric, cardiants, immunomodulators and antiinflammatories. Accordingly, through gene therapy, they can be used for the treatment of cancer, hyperplassis, restenosis, cardiac hypertrophy, immune disorders and inflammation. This polynucleotide sequence is human KID DNA (SeqID 3) encoding a full length KID enzyme of the invention.

The invention relates to human microtubule motor proteins and the nucleic acids encoding them. The invention also relates to a method of screening for modulators of a motor protein which has microtubule stimulated ArPase activity, a method of testing for ArPase activity of microtubule motor proteins, methods to identify candidate agents that bind to a target protein or act as a modulator of the binding characteristics or protein or act as a modulator of the binding characteristics or protein, and methods of treating callular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with Kinesin-like DNA binding protein (KID) and for inhibiting KID. The sequences are used for screening for modulators of motor protein useful for treating cellular proliferation disorders such as cancer, hyperplasias, restenosis, cardiac hypertrophy, immune disorders and inflammation, for treating disorders associated with KID and for inhibiting KID and for treating disorders associated with KID and for inhibiting KID and for treating disorders cassociated with KID and for inhibiting KID and for treating autoimmune diseases, arthritis, graft rejection, inflammatory bowel disease and cassociated with KID and for inhibiting KID and for treating succimune and proliferation induced after medical procedures including surgery and and protein of the invention. Note: The specification states that this sequence encodes the protein featured as SEQ ID NO:4, but this does not appear to be the case.

Example 47; SEQ ID NO 426; 612pp; English.

The present invention describes a method for modulating the expression of a thanatos (death)-associated protein (THAP) responsive gene. The method comprises modulating the interaction of a THAP-family polypeptide or its biological fragment with a nucleic acid, and so enhancing or repressing the expression of a gene. Also described: (1) a method of modulating the expression of a gene. Also described: (1) a method comprising the expression of a gene responsive a THAP responsive element in a pharmaccutical carrier; (3) a transcription factor decoy comprising a transcription factor decoy described above; (5) methods of modulating the interaction between a nucleic acid and a THAP-family polypeptide or its biological fragment, or a nucleic acid and a THAP-family polypeptide or its biological fragment, or a nucleic acid and a transcription a THAP-family polypeptide or its biological fragment, or a nucleic acid and a method of constructing a cell which expresses a cell comprising a viral vector which comprise a promoter operably linked to a nucleic acid encoding a THAP-family polypeptide; (8) a method of constructing a cell which expresses a comprising a THAP-family polypeptide; (9) methods of identifying a test compound that modulates transcription submothment or that modulates transcription at a THAP-family polypeptide; (9) methods of identifying a test compound that modulates transcription at a THAP-family polypeptide; (9) methods of identifying a test compound that modulates transcription at a THAP-family polypeptide; (10) methods of identifying a test compound that modulates transcription at a THAP-family polypeptide; (10) and condition selected from excessive or insufficient apoptosis, cardiovacular disease and neurodegenerative arising at chemokine or a THAP-family polypeptide in an individual; (11) a vector comprising a thap responsive promoter operably linked to a nucleic acid comprising a theorem about that a postibular and that expression or acivation mediated by a THAP-family polypeptide in an individual; c

σ

polypeptide or its biological fragment; (13) an in vitro transcription reaction comprising a nucleic acid comprising a THAP responsive promoter, ribonucleotides and an RNA polymerase; and (14) an isolated mutant THAP-family polypeptide that does not bind to a chemokine. The pharmaceutical composition has antiangiogenic, antiinflammatory, cardiovascular, oryostatic, neuroprotective and osteopathic activities, and can be used as a THAP and THAP synthesis modulator. The composition can be used for modulating the expression of a THAP responsive gene. Modulation us useful for reducing symptoms of conditions such as excessive or insufficient angiogenesis, inflammation, metastasis of a cancerous tissue, excessive or insufficient apoptosis, cardiovascular disease or neurodegenerative diseases. The present sequence is used in the exemplification of the Sequence 2097 BP; 483 A; 592 C; 628 G; 394 T; 0 U; 0 Other; present invention.

784 AACAAGGGCCTTCGGCTAAAAGAGAGTGGAGCCATCAACACCTCCCTGTTTGTCCTGGGC

The invention elates to novel isolated, enriched or purified nucleic acid molecules encoding a kinase polypeptide. The nucleic acid molecule comprises a sequence that: (a) encodes a kinase polypeptide; (b) is a complement of (a); (c) hybridizes under stringent conditions to (a) and encodes a naturally occurring kinase polypeptide; (d) encodes the polypeptide in (a), except that it lacks one or more, but not all, of an N-terminal domain, C-terminal catalytic domain, a catalytic domain, a spacer region and a C-terminal domain, a coiled-coil structure region, a spacer region and a C-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for chaptorsisty, in assessing biodiversities, or in identifying mutations in forensics, in assessing biodiversities, or in identifying mutations cresponsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for protein, or in generating antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence for this patent did not form part of the printed specification, but was contained in electronic format directly from USPFO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ľ,

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-concession comprising a plurality of single exon nucleic acid molecule probes cited above, where each of the plurality of single exon nucleic acid probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a wector comprising at least 8 contiguous amino acids of any of the above mentioned amino acid of probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above mentioned amino acid sequences (optionally with conservative amino acid substitutions), and solated antibody that binds specifically to a peptide cited above, methods of sequences (optionally with conservative amino acid substitutions) and conservations at customer desiring at omeasure gene expression, a method of providing a customer desiring and/or licensing single exon probes or microarrays to the above. The probe, methods mad apparatus are useful in gene capression analysis. The probes may be used as tools for surveying the above. The probes may be used as tools for surveying the above. The probes may be used as tools for surveying the above. The probes are used in identifying and characterising and encounter in determined in dentifying and characterising and encounter in determined in dentifying and characterising and encounted in definition, the probes are useful in dentifying and encounted in definition and encounted in definition and encounted in addition and encounte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             alternative splicing events, in detecting and characterising gross alterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          688 GTGGACCAGCGGGAACGTTTGGCCCCATTTCGCCAGCAGGAAAACTCTACCTGATT 747

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel human polynuclectide and the encoded polypeptide. A polynuclectide of the invention May have a use in gene therapy. An oligonuclectide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynuclectide or as a probe for detecting the polynuclectide. The polynuclectides ADM01316-ADM03758 are useful in gene therapy, for developing a diagnostic marker or medicines for regulating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynuclectides are useful as pharmaceutical agents. The present sequence represents a cDNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  190 TACCAGITIGAIGCCTICIAIGGGGAGGAGGAGTACTCAGCAGGACAICTAIGCAGGTICA
